HYDRAULIC FRACTURING

Hydraulic fracturing is the use of fluid and material to create or restore small fractures in a formation in order to stimulate production from new and existing oil and gas wells. This creates paths that increase the rate at which fluids can be produced from the reservoir formations, in some cases by many hundreds of percent.

INSTRUCTIONS

1. Download FracFocus Data from the link : http://fracfocus.org/data-download
2. Store the data in an appropriate database for enabling further processing and analysis
3. Run mathematical/statistical analysis of your choosing to make sense of the raw data
4. Make visualizations to present your results
5. Deploy your visualizations on a web application dashboard

- Choose the best suited scripting language for your analysis
- Choose a database which best assists you in achieving your results
- Be creative with your analysis and dashboard
